

● MARITIME RISK INTELLIGENCE

Wake AI

Making dark shipping
visible.

PENN BUILT

From signal gaps
to actionable cases.

SEPT 2026

When a vessel goes dark, the trail goes cold.

Vessels can disable AIS—the system that broadcasts their location, speed, and heading.

That blackout can hide sanctioned oil movements and ship-to-ship cargo transfers.

Not a fringe problem.

558

average suspected
dark tankers

~25%

of the global crude
tanker fleet

7.8M

metric tons of crude
moved per month

43%

of officially recorded global seaborne crude exports in the study comparison

One signal is never enough.

AIS gaps

When & where a vessel disappears

Geography

Risky routes & sanctioned-port proximity

Behavior

Speed, heading & voyage anomalies

Proximity

Potential ship-to-ship transfers

KEY PRINCIPLE An AIS gap is not proof. Context turns a gap into a lead.

Wake AI finds the signals worth waking up to.

× DETECT × CONNECT × EXPLAIN × PRIORITIZE

Watch a blackout become a case.

01 Normal voyage begins

02 AIS signal disappears

03 Wake AI finds correlated risk signals

04 Analyst receives the evidence-backed case

How Wake AI works.

DETAIL TO BE ADDED: data sources, model logic, and analyst interface.

● WAKE AI

When ships go dark, risk should not.

Make maritime activity visible, explainable, and actionable.
